Subject: NC Targeted Data Report Dec 2018 data

Hi Mark

This is the report you gave as powerpoint to NCDEQ in DEC 2018. Targeted analysis. Last group of Cape Fear River samples. You've seen a draft of the data report.

Just a quick question. Verifying methods:

- 1) Targeted analysis was done on all samples using an internal standard and calibration curve. Correct?
- 2) Legacy PFAS used "authentic" standards. Is there a better description or name for that?
- 3) A number of compounds used standards provided by Chemours. These are still standards, though, and this is not NTA, right?.
- 4) I know you've said you have less confidence in Chemours standards. Is there a sentence for that, other than the analyst had less confidence, which I'm good with but I get questions?
- 5) These were done on the TOF, right?

I'll send revised version.
